Final Diagnosis: Structurally normal heart
No evidence of congenital heart disease
No evidence of hypertrophic cardiomyopathy

History and Clinical Problems: Name: Forest Pearl Jd

Age: 2 years

Sex: Male

Breed: Maine Coon

Examination today for hypertrophic cardiomyopathy or other cardiac disease.

Diagnostic Procedures and Physical Findings:

Examination was limited to evaluation (screening exam) of the heart

Auscultation: no cardiac murmur was evident; normal heart rhythm

Screening ("CERF") examination of the heart

Cardiac auscultation by a board-certified cardiologist

2D and M-mode echocardiography

Doppler studies were performed only when a significant heart murmur was identified

Echocardiography:

A screening echocardiogram was performed

This examination emphasized cardiac chamber size, wall thicknesses, and heart function

2D echocardiographic imaging was within limits of normal -

There was no evidence of congenital heart malformation or of hypertrophic cardiomyopathy

Ventricular systolic function was normal

Recommendations and Instructions: No therapy

Prognosis: This screening ("CERF") examination did not reveal any evidence of congenital or acquired heart disease.

Some disorders, such as hypertrophic cardiomyopathy (HCM) are classified as adult-onset, genetic heart diseases. These may develop later in life and for this reason the examination findings should be interpreted as "normal for this time frame".

Cats used for recurrent breeding should be re-evaluated at regular intervals (e.g., yearly) since HCM can develop later in life, even after a normal screening examination.

Next Appointment: If breeding is continued a reevaluation echocardiogram should be scheduled in approximately one year. You can discuss this with the cardiologist if you have any questions.

Thank you. We appreciate your patronage. Your support of our programs is important. Please do not hesitate to contact us if you have any questions about our evaluation or instructions.
